22	(3)	47	(4)	72	(3)	97	(2)	
23	(2)	48	(1)	73	(2)	98	(4)	
24	(3)	49	(2)	74	(2)	99	(1)	
25	(2)	50	(1)	75	(1)	100	(4)	1

16. (2)
$$2187 \times \frac{1}{3} = 729; 729 \times \frac{1}{3} = 243;$$

 $243 \times \frac{1}{3} = 81; 81 \times \frac{1}{3} = 27$
 $27 \times \frac{1}{3} = 9; 9 \times \frac{1}{3} = 3$

- 17. (2) $4 = 2 \times 2$ $18 = 3 \times 6$ $48 = 4 \times 12$ $100 = 5 \times 20$ $180 = 6 \times 30$ $294 = 7 \times 42$ $448 = 8 \times 56$
- 18. (3) Using the correct symbols, we have : Given expression

$$= 26 \times 74 \div 5 + 2 = 26 \times \frac{37}{2} - 5 + 2$$

~ -

$$= 13 \times 37 - 5 + 2 = 481 - 5 + 2 = 478$$

$$20$$
 (2)

22. (3) 23. (2)

(A)

10

(2) Let number of 20 paise coins = x21. Then, 25 paise coins = 324 - x $\Rightarrow 0.2x + (324 - x)0.25 = 71$

$$\Rightarrow$$
 x = 200, so, (324 - x) = 124 coins.

(4) Worm is the food of snake. 1.

- 2. (3) Dictionary contains words.
- 3. (4) River contains flowing water. Similarly, pool contains stagnant water.
- 4. (2)SH is the adjacent pair of IR.
- 5. (2)
- 6. (2)
- 7. (4) All except Aluminum are magnetic metal.
- 8. Each of the numbers except 48, is one more than the (1)square of a certain number.
- 9. (2) B > A > E, C > B, B > D > A, C > B > D > A > E
- (3) Clearly, each word is coded by the numeral which is 1 10. less than the number of letters in the word.
- (4) Since, there are three Z's in consecutive order. 11.
- (2) If 26th August in a year is Thursday. Hence, next 12. Sunday is on 29th August. Hence total number of Sunday is 29, 22, 15, 8, 1.
- 13. (4) Brother -- in- law.
- 14. (1)
- 15. (4) L.C.M. of 54, 42 and 63

= 378 seconds =
$$\frac{378}{60}$$
 min = $6\frac{3}{10}$ min.

$$(27 \div 3) + (27 \div 3) + (27 \div 3)$$

24. (3) We have:

 $(16 \div 4) = 13; (42 \div 7) + (65 \div 13) = 11.$ So, missing number = $(27 \div 9) + (72 \div 8) = (3+9) =$ 12.

5

 $x = \sqrt{8 + 2x}$ Squaring both sides, we get $x^2 = 8 + 2x$ $\therefore x = 4$

52. (1)
$$\frac{(3.07)^2 + (0.0193)^2}{(0.307)^2 + (0.00193)^2} = \frac{(3.07)^2 + (0.0193)^2}{\left(\frac{3.07}{10}\right)^2 + \left(\frac{0.0193}{10}\right)^2}$$
$$= 100 \left[\frac{(3.07)^2 + (0.0193)^2}{(3.07)^2 + (0.0193)^2}\right] = 100$$

53. (2) Men to be arranged =
$$(6000 - 71) = 5929$$

Number of men arranged in each row
 $= \sqrt[2]{5929} = 77$

54. (2) $\sqrt{7} - \sqrt{5}, \sqrt{5} - \sqrt{3}, \sqrt{9} - \sqrt{7}, \sqrt{11} - \sqrt{9}$ On rationalizing each term

$$=\frac{2}{\sqrt{7}-\sqrt{5}},\frac{2}{\sqrt{5}-\sqrt{3}},\frac{2}{\sqrt{9}-\sqrt{7}},\frac{2}{\sqrt{11}-\sqrt{9}}$$

Smallest denominator = $\sqrt{5} + \sqrt{3}$

So largest value = $\sqrt{5} - \sqrt{3}$

55. (3) 1000 is not a perfect square so we need to make perfect square.

32					
3	10000				
3	9				
62	100				
2	124				
	24				

We need 24 more plants.

56. (1)
$$57^{25} - 1 = 7^{1} - 1 = 6$$
 [:: $25 = 4 \times 6 + 1$]
57. (1) I no. × II no. = L.C.M. × H.C.F.
($x^{2} + 2x - 3$)× P = ($x^{3} + 7x + 6$)×($x + 3$)
 $\Rightarrow P = \frac{(x^{2} + 7x + 6)(x + 3)}{x^{2} + 2x - 3}$
64. (1)

$$\Rightarrow \mathbf{P} = (\mathbf{x} + 3)(\mathbf{x} - 2) = \mathbf{x}^2 + \mathbf{x} - \mathbf{e}$$

58. (2) Average age of the couple is 25 years. The sum = $2 \times 25 = 50$ years After 3 years, sum = $50 + 2 \times 3 = 56$ years Age of baby = 2 years

The average
$$=\frac{56+2}{3}=\frac{58}{3}=19\frac{1}{3}$$
 years

59. (3) Let minors be x. Consumption by adults = $8 \times 15 = 120$ Total Consumption = $(x + 8) \times 10.8$ Average consumption by minor

$$=\frac{(8+x)10.8-120}{x}=6$$

$$\Rightarrow x = 7$$

60. (3) Sum of 8 numbers = $20 \times 8 = 160$

$$\left(15\frac{1}{2}\right) \times 2 + \left(21\frac{1}{3}\right) \times 3 + x + x + 4 + x + 7 = 160$$
$$\Rightarrow 31 + 64 + 3x + 11 = 160 \Rightarrow 3x = 160 - 106$$
$$\Rightarrow x = \frac{54}{3} \Rightarrow x = 18$$

8th number = x + 7 = 18 + 7 = 25

61. (1) Students failed in Hindi = 100% - 80% = 20% Students failed in mathematics = 100% - 75% = 25% Students failed in both subjects = 18%

SSC CHSL : TIER-1

Students passed in both subjects = 100 - (25 + 20 - 18) = 73%Let total sutdents be x.

$$\Rightarrow \frac{\mathbf{x} \times 73}{100} = 438 \Rightarrow \mathbf{x} = 600$$

Total sutdents is 600.

62. (4) Let the total number of voters be x.

Number of votes cast in the election = $\frac{92}{100}$ x

Number of votes obtained by winner = $\frac{48}{100}$ x

Number of votes obtained by the defeated candidate

$$=\frac{(92-48)}{100}x=\frac{44}{100}x$$

From question, $\frac{48x}{100} - \frac{44x}{100} = 1100$

 $\Rightarrow 4x = 110000 \Rightarrow x = 27500$ Total number of voters = 27,500. According to the question, let the number are a and b.

(a-b): (a+b): ab = 1:7:24Numbers are a = 8, b = 6So product $= 8 \times 6 = 48$ Let the length of candle be 1.

Rate of burn of first candle =
$$\frac{1}{4}$$
 per hour

The rate of burn of second candle = $\frac{1}{3}$ per hour

Let after x hour the ratio be 2 : 1.

$$\Rightarrow \frac{4-x}{4} = 2\left(\frac{3-x}{3}\right)$$

$$\Rightarrow$$
 x = $2\frac{2}{5}$ hours = 2 hours 24 min.

65. (1) Cost of raw material = 4xCost of labour = 3xCost of miscellaneous = 2xThe total cost = 4x + 3x + 2x = 9x

Amount =
$$\frac{4x \times 110}{100} + \frac{3x \times 108}{100} + \frac{2x \times 95}{100}$$

Percentage rise =
$$\frac{9.54x - 9x}{9x} \times 100 = 6\%$$

66. (4) Given, Total earning of A + B + C = 760000 ...(1) Percentage of their saving are 30%, 25% and 20% respectively. Let, savings of A, B and C be 4x, 5x and 6x respectively. Now, 30% of A = 4x

Grand Test : CHT1-180111

or,
$$30 \times \frac{A}{100} = 4x \Longrightarrow A = \frac{40}{3}x$$
 ...(2)

Also, 25% of
$$B = 5x$$

Or,
$$25 \times \frac{B}{100} = 5x \Rightarrow B = 20x$$
 ...(3)

Also, 20% of C = 6x

Or,
$$20 \times \frac{C}{100} = 6x \Rightarrow C = 30x$$
 ...(4)

On using (2), (3) and (4) in (1), we get

$$\frac{40x}{3} + 20x + 30x = 76000 \Rightarrow x = 1200$$

$$\therefore A = \frac{40x}{3} = \frac{40}{3} \times 1200 = 16000$$

$$B = 20x = 20 \times 1200 = 24000$$

$$C = 30x = 30 \times 1200 = 36000$$

$$\therefore (A + B) - C = (16000 + 24000) - 36000 = \text{Rs.4000.}$$

67. (3) Let money be P.

$$\frac{P \times 12 \times 4}{100} - \frac{P \times 15 \times 5}{100} = 1890$$
$$\Rightarrow \frac{27P}{100} = 1890 \Rightarrow P = \frac{1890 \times 100}{27} = Rs.7000$$

68. (1) Let initial amount = Rs. x

$$\frac{x}{3} \times \frac{7 \times 2}{100} + \frac{2}{5} \times \frac{x \times 10 \times 2}{100} + \frac{4 \times x \times 12 \times 2}{15 \times 100} = 1430$$
$$\Rightarrow \frac{14x}{300} + \frac{4x}{50} + \frac{8x}{125} = 1430$$

$$\Rightarrow x = \frac{1430 \times 750}{143} = \text{Rs.7500}$$

69. (4) $DE \parallel BC$ (given)

Since $\triangle ADE$ and $\triangle ABC$ are similar

$$\frac{\operatorname{ar}(\operatorname{ADE})}{\operatorname{ar}(\operatorname{ABC})} = \left| \frac{\operatorname{AD}}{\operatorname{AB}} \right| \Rightarrow \sqrt{\frac{1}{2}} = \frac{\operatorname{AD}}{\operatorname{AB}}$$
$$\Rightarrow \frac{\operatorname{AD}}{\operatorname{AB}} = \sqrt{\frac{1}{2}} \Rightarrow \frac{\operatorname{AD}}{\operatorname{BD}} = \frac{1}{\sqrt{2} - 1}$$

70. (3) Length of the common tangent = $\sqrt{a^2 - (6+3)^2}$

:
$$8 = \sqrt{a^2 - (6+3)^2}$$

or, $a^2 = 64 + 81 = 145 \implies a = \sqrt{145}$

Distance between their centres = $\sqrt{145}$ cm

cm

3

- 71. (3) Since the sum of any two sides of a triangle is greater than the 3rd side. 2+3>5, which is wrong.
 - 2+3>6, which is wrong.

 \therefore (2, 3, 5) or (2, 3, 6) will not form a triangle.

Triplets (3, 5, 6) and (2, 5, 6) are true for the sides of a triangle = 2 triangles.

72. (3)
$$E$$

A
 x
A
 x
C

In DADE, $AE = AB \Longrightarrow AE = AD$ $\therefore \angle E = \angle D = \theta$ (say) $\Rightarrow \angle A = \theta + \theta = 2\theta$ Similarly, In $\triangle BCE$, $BE = AB \implies BF = BC$ $\angle C = \angle F = \phi \text{ (say)} \Longrightarrow \angle B = 2\phi$ In rhombus ABCD, $\angle A = \angle B = 180^{\circ}$ $\Rightarrow 2\theta + 2\phi = 180^{\circ} \Rightarrow \theta + \phi = 90^{\circ}$ $\therefore \angle EOF = 90^\circ \Rightarrow ED \perp CF$ $l\cos^2\theta + m\sin^2\theta = \frac{\cos^2\theta(1+\sin^2\theta)}{\cot^2\theta\sin^2\theta}$

$$\Rightarrow l\cos^2\theta + \cos^2\theta - m\cos^2\theta = 2 - m$$

$$\Rightarrow \cos^2 \theta = \frac{2 - m}{1 - m + 1} \text{ or } \sec^2 \theta = \frac{l - m + 1}{2m}$$

Or, $\tan^2 \theta = \frac{l - 1}{2 - m} \Rightarrow \tan \theta = \sqrt{\frac{l - 1}{2 - m}}$

74. (2) Rate of processing cost of water for industrial, energy and domestic usage = 3:5:2

> In 2006, water usage for industrial, energy and domestic = 25, 26 and 16 litres

- In 2009, water usage for industrial, energy and domestic
- =49, 35, 30 trillion litres

Or, $\tan^2 \theta =$

(2)

... Ratio of processing cost for above mentioned usage in 2006 to that in 2009

$$=\frac{25\times3+26\times5+35\times2}{49\times3+35\times5+30\times2} = \frac{75+130+70}{147+175+60}$$
$$=\frac{275}{382} = 0.72$$

75. (1) Usage in energy related sector in 2006 = 26 trillion litres Usage in energy related sector in 2009 = 35 trillion litres

Required percentage increase

$$=\frac{35-26}{26}\times100=34.6\%$$
